Central Washington University, USA

<https://www.kdd.org/kdd2019/tutorials>

CWU Tutorial [Website](#)

http://www.cwu.edu/~borisk/KDD2019_Tutorial/KDD_Tutorial-BK.htm

Schedule

- August 4
- Time:
 - *13:00 PM -17:00 PM*
 - *2:30-3pm Break*
- Egan Convention Center
 - Summit 11-Ground Level

Overview

The noblest pleasure is the joy of understanding.
Leonardo da Vinci

- This tutorial covers the state-of-the-art research, development, and applications in the KDD area of
 - *interpretable knowledge discovery reinforced by visual methods to stimulate and facilitate future work.*
- The topic is interdisciplinary bridging of scientific research and applied communities in
 - *KDD, Visual Analytics, Information Visualization, and HCI.*
- This is a novel and fast growing area with significant applications, and potential.
- in KDD, these studies have grown under the name of **visual data mining**.
- The recent growth under the names of **deep visualization**, and **visual knowledge discovery**, is motivated considerably by
 - *deep learning success in accuracy of prediction and*
 - *its failure in providing **explanation/understanding of the produced models** without special interpretation efforts.*
- In the areas of Visual Analytics, Information Visualization, and HCI, the increasing **trend toward machine learning** tasks, including deep learning, is also apparent.
- This tutorial reviews progress in these areas with analysis of what each area brings to the joint table.

Overview

- The tutorial covers **five complementary approaches**:
 1. to **visualize** ML models produced by **analytical** ML methods,
 2. to **discover** ML models by **visual** means,
 3. to **explain** deep and other ML models by visual means,
 4. to **discover visual** ML models assisted by **analytical** ML algorithms,
 5. to **discover analytical** ML models assisted by **visual** means.
- What is not covered
 - SAS visual data mining and machine learning that is a visual **interface** for all analytical ML steps that integrates analytical processes.
 - Its focus on interface differs from 1-5

- Sources and audience

- Multiple relevant publications including presenter's books:
 - “Visual and Spatial Analysis: Advances in Visual Data Mining, Reasoning, and Problem Solving” (Springer, 2005), and
 - “Visual Knowledge Discovery and Machine Learning” (Springer, 2018).
- The target audience
 - KDD researchers, graduate students, and practitioners with the basic knowledge of machine learning.

Dr. Boris Kovalerchuk

- [Dr. Boris Kovalerchuk](#) is a professor of Computer Science at Central Washington University, USA. His publications include three books "Data Mining in Finance " (Springer, 2000), "Visual and Spatial Analysis" (Springer, 2005), and "Visual Knowledge Discovery and Machine Learning" (Springer, 2018), a chapter in the Data Mining Handbook and over 170 other publications.
- His research interests are in data mining, machine learning, visual analytics, uncertainty modeling, data fusion, relationships between probability theory and fuzzy logic, image and signal processing.
- Dr. Kovalerchuk has been a principal investigator of research projects in these areas supported by the US Government agencies. He served as a senior visiting scientist at the US Air Force Research Laboratory and as a member of expert panels at the international conferences and panels organized by the US Government bodies.
- <http://www.cwu.edu/~borisk>

Highlights

- Enhancing visualization and machine learning for **discovering hidden understandable patterns in multidimensional data (n-D data)**.
 - The fundamental challenge -- we cannot see multidimensional data with a naked eye and need visual analytics tools ("**n-D glasses**"). It starts at 4-D.
- Often we use *non-reversible, lossy dimension reduction methods* such as Principal Component Analysis that convert, say, every 10-D point (10 numbers) to 2-D point (two numbers) in visualization.
 - They are very useful, but they can *remove important multidimensional information* before starting discovering complex n-D patterns.
- The **hybrid methods** combine advantages of reversible and non-reversible methods for knowledge discovery in n-D data.
- **We will review reversible and non-reversible visualization methods and combine them with analytical ML/DM methods for knowledge discovery.**

Black box vs. White box

Black Box Models

- Deep learning Neural networks
- Boosted trees
- Random forests
-

Often less interpretable but more accurate.

White Box Models

- Single Decision Trees
- Naive-Bayes
- Bayesian Networks
- Propositional and First Order Logic rules

Often less accurate but more interpretable and human understandable

Often we are forced to choose between accuracy and interpretability. It is a major obstacle to the wider adoption of Machine Learning in areas with high cost of error, such as in cancer diagnosis, and many other domains where it is necessary to understand, validate, and trust decisions. Visual Knowledge discovery helps to get both model **accuracy and its explanation**

APPROACHES

Approaches to visualize Machine Learning (ML) models produced by the analytical ML methods

- These visualization of ML models are used
 - *to demonstrate and understand ML models such as CNN, Association Rules and others,*
 - *to show the superposition of input data/images with heat maps of model layers,*
 - *dataflow graph in Deep Learning models,*
 - *differences in the internal representations of objects, adversarial cases and others using t-SNE and other visualization methods.*

Demonstration of DNN models to understand them via heat maps visualizing discovered features

Geoffrey Hinton
and Yann LeCun:
Turing Lecture

[video](https://www.youtube.com/watch?v=VsnQf7exv5I)

<https://www.youtube.com/watch?v=VsnQf7exv5I>

Visualization of Association Rules

- Example: rule {onions, potatoes} $\Rightarrow$ {burger}
 - If customers buy both onions and potatoes, they are more likely to buy a burger.
- Association rules – interpretable
- Challenges –
 - limited specifics (e.g., why rule confidence is less than 100%?)
 - incomplete understandings of relation strength
 - How to identify uncertainty of patterns, outliers.
 - Deleting many non-interesting rules.
- Quality Measures:
 - Support – how frequently an itemset appears in the dataset.
 - Confidence, $\text{conf}(X \Rightarrow Y) = \text{supp}(X \& Y) / \text{supp}(X)$ – fraction of transactions with X and Y.
 - Lift, $\text{lift}(X \Rightarrow Y) = \text{supp}(X \& Y) / (\text{supp}(X) \times \text{supp}(Y))$ – the ratio of the observed support to that expected if X and Y are independent.

If A then B, $A \Rightarrow B$
 If B then C
 If C then A
 If D then B
 If D then C

LHS

	A	B	C	...
A				
B				
C				
D				
....				
....				
....				

- Visualization approaches:
 - Matrix with rows as Left Hand Side, LHS itemsets of rules and columns as Right Hand side (RHS) itemsets of rules.
 - Parallel sets
- Challenges:
 - Scalability for many LHS and RHS
 - readability of small cells having many categories in variables.

Zhang C. et al. Association rule based approach to reducing visual clutter in parallel sets, Visual Informatics 3 (2019) 48–57

Visualization of Association Rules (AR) using Parallel sets for categorical data

- Approach:
 - *Discovering AR.*
 - *Deleting dimensions irrelevant to AR.*
 - *Feeding rules to two **coordinated rule visualizations** (called ARTable and ParSets),*
- User interactions:
 - *Visually explore rules in ARTable*
 - *Find interesting rules, dimensions, and categories in ARTable*
 - *Create and optimize the layout of ParSets*
 - *Validate interesting rules*
 - *Explore details of rules in ParSets using domain knowledge*

Before

After

Zhang C. et al. Association rule based approach to reducing visual clutter in parallel sets, Visual Informatics 3 (2019) 48–5

ParSets displays dimensions as adjacent **parallel axes** and their values (categories) as **segments** over the axes (points in Parallel Coordinates [Inselberg, 2009]). Connections between categories in the parallel axes form **ribbons** (lines in parallel coordinates). The ribbon crossings lead to visual **clutter**.

Titanic example: Clutter 16.86% – alphabetical ordering of dimensions and categories.

Clutter 11.71% – ordering by the number of grades (categories) in each coordinate.

Approach to Reducing Visual Clutter in Parallel Sets

B: ParSets show dimensions in the order displayed in the ARTable.

The dimensions in the clicked rule are sorted with the outcome dimension: Edible is on the top. Enabling the filter of “Rule-related category”,

Categories absent in ARTable are greyed out.

Green: Edible = Yes,
magenta: Edible = No (Poisonous).

Top of the tabular view. -- a strong rule between odor and edible mushrooms ($\{\text{odor} = \text{none}\} \Rightarrow \{\text{edible} = \text{Yes}\}$).

ParSets places the identified dimension odor right under the top outcome dimension edible

Outlier of the rule is highlighted in the ParSets -- a small magenta connection in the odor = none emerges

Measure the level of clutter. Idea -- deviation from going straight

A: Association Rule Table (ARTable) -- the rules with sorting panel.
Columns -- dimensions extracted from association rule result.
Rows -- rules with cells indicating the itemsets in the rule.
Color intensity expresses % or rule support..

Visualizing dataflow graphs of deep learning models in Tensorflow

- **Problem:**
 - Difficulties to optimize **Deep Neural Networks (DNN)** models due to lack of understanding of how the models work (**Black-box problem**).
 - Approach: can improve the transparency and interpretability of the models and help open these “black boxes” [34, 54].
- **Goals:** Visualization of NN to
 - **monitor** learned parameters and output metrics
 - help train and **optimize** NN models.
 - help understand the **structure of dataflow** graphs of arbitrary NN at the **low-level**.
- Monitoring, visualization and NN teaching tools:
 - Graph Visualizer,
 - TensorBoard, TensorFlow’s dashboard
 - Olah’s interactive essays
 - ConvNetJS,
 - TensorFlow Playground
- Modules for monitoring
 - scalar values, distribution of tensors,
 - images, audio and others.
- Tools to visualize model structure at the higher-level than TensorFlow
 - Keras, MXNet

The TensorFlow Graph Visualizer shows a convolutional network for classifying images (`tf.cifar`). (a) An overview displays a dataflow between groups of operations, with *auxiliary nodes* extracted to the side. (b) Expanding a group shows its nested structure.

Wongsuphasawat K, Smilkov D, et al., Visualizing dataflow graphs of deep learning models in tensorflow. IEEE transactions on visualization and computer graphics. 2018: 24(1):1-2.

Approaches to discover ML models by visual means

- Discovering ML models by visual means (lossless/reversible and lossy visual methods for n-D data representation based on Parallel and Radial Coordinates, RadVis, Manifolds, t-SNE General Line Coordinates, Shifted Paired Coordinates, Collocated Paired Coordinates, and others).

We are moving from *visualization of solution* to *finding solution visually*

- Why Visual?
 - To leverage human perceptual capabilities
- Why interactive?
 - To leverage human abilities to adjust tasks on the fly
- Why Machine Learning?
 - To leverage analytical discovery that are outside of human abilities.
 - We cannot see patterns in multidimensional data by a naked eye.

Visuals for creative thinking

- Scientists such as
 - Bohr, Boltzmann, Einstein, Faraday, Feynman, Heisenberg, Helmholtz, Herschel, Kekule, Maxwell, Poincare, Tesla, Watson, and Watt
- have declared the fundamental role that *images* played in their *most creative thinking*
[Thagard & Cameron, 1997; Hadamard, 1954; Shepard & Cooper, 1982].
- *Albert Einstein: The words or the language, as they are written or spoken, do not seem to play any role in my mechanism of thought.*

Chinese and Indians knew a visual proof of the Pythagorean Theorem in 600 B.C. before it was known to the Greeks [Kulpa, 1994]. Below on the left

See

$(a+b)^2$ (area of the large square) = $a^2 + b^2 + ab + ab = (a+b)^2$
 $a^2 + b^2 = (a+b)^2$ (area of the large square) - $2ab$ (4 light green triangles) = c^2 (area of inner darker green square)

Thus we follow them-- moving from *visualization of solution* to *finding solution visually with modern data science tools*.

Example of visual knowledge discovery in 2-D

x	y	class
1	0.5	1
1.1	6	2
2	1.5	1
2.2	5	2
2.8	2.8	1
3	4	2
3.5	3.3	1
4	3.8	1
4	2.6	2
4.5	4.7	1
5	1.8	2
5	5	1
5.5	5.5	1
6	0.8	2

The common guess without visualizing data is to try a simplest linear discrimination function (black line) to separate the blue and red points.
It will obviously fail.

In contrast a quick look at these data, immediately gives a visual insight of a correct model class of "crossing" two linear functions, with one line going over blue points, and another one going over the red points.

These "crossing" classes cannot be discriminated by a single straight line. Each single projection does not discriminates them. Projections overlap.

How to reproduce the success in 2-D for n-D data?

In high-dimensions we cannot see data with a **naked eye**.
We need methods for *lossless and interpretable visualization* of n-D data in 2-D.

Multidimensional visualization: Approaches

- The goal of *multivariate, multidimensional visualization* is representing n -tuples (n -D points) in 2-D or 3-D, e.g., (3, 1, 0.5, 7, 1.19, 0.13, 8.1)
- Often multidimensional data are visualized by **lossy** dimension reduction (e.g., PCA) or by **splitting** n -D data to a set of low dimensional data (pairwise correlation plots).
 - While splitting is useful it **destroys integrity** of n -D data, and leads to a **shallow understanding** complex n -D data.
- To mitigate splitting difficulty
 - an additional and difficult perceptual task of **assembling** 2-dimensional visualized pieces to the whole n -D record must be solved.
- An alternative way for deeper understanding of n -D data is
 - developing visual representations of n -D data in low dimensions **without such data splitting and loss of information as graphs not 2-D points.**
 - E.g., Parallel and Radial coordinates.
 - Challenge -- occlusion

WBC data

Benign and malignant cancer cases overlap
Interpretation of dimensions is difficult. Non-reversible lossy methods: 9-D to 2-D.

Fisher Discriminant Analysis – FDA

T. Maszczyk and W. Duch Support Vector Machines for visualization and dimensionality reduction, LNCS, Vol. 5163, 346-356, 2008

Theoretical limits to preserve n -D distances in 2-D: Johnson-Lindenstrauss Lemma

- *This lemma implies that only a small number of arbitrary n -D points can be mapped to k -D points of a smaller dimension k that preserve n -D distances with relatively small deviations.*
- Reason: the 2-D visualization space does not have enough neighbors with equal distances to represent the same n -D distances in 2-D.
- Result : the significant **corruption** of n -D distances in 2-D visualization.

Theoretical limits to preserve n-D distances in 2-D: Johnson-Lindenstrauss Lemma

Johnson-Lindenstrauss Lemma shows that to keep distance **errors within about 30%** for **just 10 arbitrary** high-dimensional points, we need over **1900 dimensions**, and over **4500 dimensions** for **300 arbitrary points**.

Visualization methods do not meeting these requirements.

Dimensions to support $\pm 31\%$ of error ($\epsilon=0.1$).

Number of arbitrary points in high-dimensional space	Sufficient dimension with formula (3.1)	Sufficient dimension with formula (3.2)_	Insufficient dimension with formula (3.3)
10	1974	2145	1842
20	2568	2791	2397
30	2915	3168	2721
40	3162	3436	2951
50	3353	3644	3130
60	3509	3813	3275
70	3642	3957	3399
80	3756	4081	3506
90	3857	4191	3600
100	3947	4289	3684
200	4541	4934	4239
300	4889	5312	4563

Review of Visual Knowledge Discovery Approaches

1. Convert n-D data to 2-D data and then discover **2-D patterns** in visualization as **points**.
2. Discover **n-D patterns** in n-D data then visualize them in 2-D as **graphs**.
3. Join 1 and 2: some patterns are discovered in (1) with controlled errors and some are discovered in (2).

1. Convert n-D data to 2-D data and then discover **2-D patterns** in visualization

n-D data

2-D data
with 2-D
patterns

- **Lossy approach**
 - **Lossy** conversion to 2-D (dimension reduction, DR)
 - Point to point (**n-D point to 2-D point**)
 - Visualization in 2-D
 - Interactive discovery of 2-D patterns in visualization
- **Lossless approach**
 - **Lossless** conversion (visualization) to 2-D (n-D data **fully restorable** from its visualization) Point to graph (**n-D point to graph in 2-D**), e.g., (5,4,0,6,5,10) to a graph
 - Interactive discovery of 2-D patterns on graphs in visualization

Examples: Example 1: linear discrimination of 4-D data, n-D point to graph

Algorithm GLC-L

- 4 coordinate lines: X_1, X_2, X_3, X_4 -- black lines (vectors) at different angles Q_1-Q_4
- 4-D point $(x_1, x_2, x_3, x_4) = (1, 0.8, 1.2, 1)$ with these values shown as blue lines (vectors)
- Shifting and stacking blue lines
- Projecting the last point to U line
- Do the same for other 4-D points of blue class
- Do the same for 4-D points of red class
- Optimize angles Q_1-Q_4 to separate classes (yellow line)

Example 2: Visual linear discrimination of 9-D Wisconsin Breast Cancer data in GLC-L coordinates

- Critical in Medical diagnostics and many other fields:
 - Explanation of patterns and
 - Understanding them
 - Lossless visual means
 - Reversible/restorable

Only one malignant (red case)
on the wrong side

Real Class	Predicted Class 1	Predicted Class 2
1	424	20
2	1	238
Accuracy is: 96.9253%		

Angles Q_1 - Q_9 – contributions of attributes X_1 - X_9

Example 3: Visual discrimination of 9-D Wisconsin Breast Cancer data in Shifted Paired Coordinates (SPC)

Point **a** in (X_1, X_2) , (X_3, X_4) , (X_5, X_6) as a sequence of pairs $(3,2)$, $(1,4)$ and $(2,6)$.

Point **a** in (X_2, X_1) , (X_3, X_6) , (X_5, X_4) as a sequence of pairs $(2,3)$, $(1,6)$ and $(2,4)$.

WBC data in 4-D SPC as graphs in coordinates (X_9, X_8) and (X_6, X_7) that are used by Rule 1, i.e., WBC cases that go through R_1 and not go to R_2 and R_3 in these coordinates.

The **WBC** explainable classification **Rule 2** is

If $(x_8, x_9) \in R_1$ & $(x_6, x_7) \notin R_2$ & $(x_6, x_7) \notin R_3$

then $\mathbf{x} \in$ class 1 (Red, Benign) else $\mathbf{x} \in$ class 2 (Blue, Malignant)

This rule classifies all cases that are either in R_2 or in R_3 or not in R_1 as blue.

It has accuracy 93.60% $(425+219)/688$ on *all 688 cases*

A set of 688 Wisconsin Breast Cancer (WBC) data visualized in SPC as 2-D graphs of 10-D points with benign cases in red and malignant cases in

WBC cases covered by else in rule 2 (dominated by blue class).

Here malignant cases (blue cases)

Example 4: **Avoiding Occlusion** with Deep Learning on WBC data

Numeric 9-D Wisconsin
Breast Cancer (WBC)
Data

Visualized numeric data as downscaled
25x25 pixels images using GLC-L method

Deep Learning Convolutional
Neural Network (CNN) on
images (GLC-L visualization)
as input

Classification accuracy 97.22%
at the level and above published in literature

WBC data samples visualized in GLC-L for
CNN model with the best accuracy.

Visualization
optimization

10-fold cross
validation

EXAMPLE 5: INTERPRETABLE DCP ALGORITHM ON WBC DATA

1. Constructing dominance intervals for classes on each attribute
2. Combining dominance intervals in the voting methods
3. Learning parameters of dominance intervals and voting methods for prediction
4. Visualizing the dominance structure
5. Explaining the prediction

General Line Coordinates (GLC)
to convert n-D points to graphs in 2-D

General Line Coordinates (GLC)

Descartes lay in bed and invented the method of co-ordinate geometry.

7-D point $D=(5,2,5,1,7,4,1)$ in Parallel Coordinates

6-D $(5,4,0,6,4,10)$ point in In-line Coordinates

7-D point $D=(5,2,5,1,7,4,1)$ in Radial Coordinates.

Two 5-D points of two classes in Sequential In-Line Coordinates.

(a) 7-D point D in General Line Coordinates with straight lines.

(b) 7-D point D in General Line Coordinates with curvilinear lines.

(c) 7-D points F-J in General Line Coordinates that form a simple single straight line.

(d) 7-D points F-J in Parallel Coordinates that do not form a simple single straight line.

7-D points in General Line Coordinates with different directions of coordinates $X_1, X_2, \dots, X_7$ in comparison with Parallel Coordinates.

General Line Coordinates (GLC)

n-Gon (rectangular) coordinates with 6-D point (0.5, 0.6, 0.9, 0.7, 0.7, 0.1).

(a) Point A in in 3-Gon coordinates.

(b) Point A in in radial coordinates.

3-D point A=(0.3, 0.7, 0.4) in 3-Gon (triangular) coordinates and in radial coordinates.

(a) Parallel Coordinates display.

(b) Circular Coordinates display.

(c) Spatially distributed objects in circular coordinates with two coordinates X_5 and X_6 used as a location in 2-D and X_7 is encoded by the sizes of circles.

Figure 2.5. Examples of circular coordinates in comparison with parallel coordinates.

(a) Example in n-Gon coordinates with curvilinear edges of a graph.

(b) Example in n-Gon coordinates with straight edges of a graph.

Figure 2.6 Example of weekly stock data in n-Gon (pentagon) coordinates.

General Line Coordinates (GLC): 2-D visualization

2-D Line Coordinates.

Type	Characteristics
2-D General Line Coordinates (GLC)	Drawing n coordinate axes in 2-D in variety of ways: curved, parallel, unparallel, collocated, disconnected, etc.
Collocated Paired Coordinates (CPC)	Splitting an n -D point x into pairs of its coordinates $(x_1, x_2), \dots, (x_{n-1}, x_n)$; drawing each pair as a 2-D point in the collocated axes; and linking these points to form a directed graph. For odd n coordinate x_n is repeated to make n even.
Basic Shifted Paired Coordinates (SPC)	Drawing each next pair in the shifted coordinate system by adding (1,1) to the second pair, (2,2) to the third pair, $(i-1, i-1)$ to the i -th pair, and so on. More generally, shifts can be a function of some parameters.
2-D Anchored Paired Coordinates (APC)	Drawing each next pair in the shifted coordinate system, i.e., coordinates shifted to the location of a given pair (anchor), e.g., the first pair of a given n -D point. Pairs are shown relative to the anchor easing the comparison with it.
2-D Partially Collocated Coordinates (PCC)	Drawing some coordinate axes in 2D collocated and some coordinates not collocated.
In-Line Coordinates (ILC)	Drawing all coordinate axes in 2D located one after another on a single straight line.
Circular and n -Gon coordinates	Drawing all coordinate axes in 2D located on a circle or an n -Gon one after another.
Elliptic coordinates	Drawing all coordinate axes in 2D located on ellipses.
GLC for linear functions (GLC-L)	Drawing all coordinates in 2D dynamically depending on coefficients of the linear function and value of n attributes.
Paired Crown Coordinates (PWC)	Drawing odd coordinates collocated on the closed convex hull in 2-D and even coordinates orthogonal to them as a function of the odd coordinate.

General Line Coordinates (GLC): 3-D visualization

3-D Line Coordinates.

Type	Characteristics
3-D General Line Coordinates (GLC)	Drawing n coordinate axes in 3-D in variety of ways: curved, parallel, unparallel, collocated, disconnected, etc.
Collocated Tripled Coordinates (CTC)	Splitting n coordinates into triples and representing each triple as 3-D point in the same three axes; and linking these points to form a directed graph. If $n \bmod 3$ is not 0 then repeat the last coordinate X_n one or two times to make it 0.
Basic Shifted Tripled Coordinates (STC)	Drawing each next triple in the shifted coordinate system by adding (1,1,1) to the second tripple, (2,2,2) to the third tripple ($i-1, i-1, i-1$) to the i -th triple, and so on. More generally, shifts can be a function of some parameters.
Anchored Tripled Coordinates (ATC) in 3-D	Drawing each next triple in the shifted coordinate system, i.e., coordinates shifted to the location of the given triple of (anchor), e.g., the first triple of a given n -D point. Triple are shown relative to the anchor easing the comparison with it.
3-D Partially Collocated Coordinates (PCC)	Drawing some coordinate axes in 3-D collocated and some coordinates not collocated.
3-D In-Line Coordinates (ILC)	Drawing all coordinate axes in 3D located one after another on a single straight line.
In-Plane Coordinates (IPC)	Drawing all coordinate axes in 3D located on a single plane (2-D GLC embedded to 3-D).
Spherical and polyhedron coordinates	Drawing all coordinate axes in 3D located on a sphere or a polyhedron.
Ellipsoidal coordinates	Drawing all coordinate axes in 3D located on ellipsoids.
GLC for linear functions (GLC-L)	Drawing all coordinates in 3D dynamically depending on coefficients of the linear function and value of n attributes.
Paired Crown Coordinates (PWC)	Drawing odd coordinates collocated on the closed convex hull in 3-D and even coordinates orthogonal to them as a function of the odd coordinate value.

Reversible Lossless Paired Coordinates

(a) Collocated Paired Coordinates.

(b) Shifted Paired Coordinates.

6-D point $(5,4,0,6,4,10)$ in Paired Coordinates.

(a) Collocated Paired Coordinates

(b) Parallel Coordinates

State vector $\mathbf{x} = (x, y, x', y', x'', y'') = (0.2, 0.4, 0.1, 0.6, 0.4, 0.8)$ in Collocated Paired and Parallel Coordinates.

6-D point $\mathbf{x} = (x, y, x', y', x'', y'') = (0.2, 0.4, 0.1, 0.6, 0.4, 0.8)$ in Anchored Paired Coordinates with numbered arrows.

Reversible lossless Paired Coordinates

6-D point as a closed contour in 2-D where a 6-D point $\mathbf{x}=(1,1,2,2,1,1)$ is forming a triangle from the edges of the graph in Paired Radial Coordinates with non-orthogonal Cartesian mapping.

6-D point $(1, 1, 1, 1, 1, 1)$ in two X_1 - X_6 coordinate systems (left – in Radial Collocated Coordinates, right – in Cartesian Collocated Coordinates).

(a)

(b)

(c)

n-D points as closed contours in 2-D: (a) 16-D point $(1,1,2,2,1,1,2,2,1,1,2,2,1,1,2,2)$ in Partially Collocated Radial Coordinates with Cartesian encoding, (b) CPC star of a 192-D point in Polar encoding, (c) the same 192-D point as a traditional star in Polar encoding.

4-D point $P=(0.3, 0.5, 0.5, 0.2)$ in 4-D Elliptic Paired Coordinates, EPC-H as a green arrow. Red marks separate coordinates in the Coordinate ellipse.

4-D point $P=(0.3, 0.5, 0.5, 0.2)$ in Radial Coordinates.

Reversible lossless Paired Coordinates

Partially Collocated Orthogonal (Ortho) Coordinates.

Partially Collocated Ortho and non-Ortho Coordinates.

Collocated Paired non-Ortho Coordinates.

34-D point in Collocated Paired Coordinates.

In Figure (a) below, the value w_5 (labeled with 1) is a starting point of the normal to the square that forms the coordinate X_6 . The length of this norm is the value of w_6 .

(a) Mapping odd coordinates to a square.

(b) Mapping odd coordinates to a circle.

34-D point from figure 2.32.in **Closed Paired Crown Coordinates** with odd coordinates mapped to the crown and even coordinates mapped dynamically to the normals to the crown

Graph construction algorithms in GLC

Six coordinates and six vectors that represent a 6-D data point $(0.75, 0.5, 0.7, 0.6, 0.7, 0.3)$

6-D data point $(0.75, 0.5, 0.7, 0.6, 0.7, 0.3)$ in GLC-CC1

6-D data point $(0.75, 0.5, 0.7, 0.6, 0.7, 0.3)$ in GLC-PC.

6-D data point $(0.75, 0.5, 0.7, 0.6, 0.7, 0.3)$ in GLC-CC2

6-D data point $(0.75, 0.5, 0.7, 0.6, 0.7, 0.3)$ in GLC-SC1.

6-D data point $(0.75, 0.5, 0.7, 0.6, 0.7, 0.3)$ in GLC-SC2

Math, theory and pattern simplification methodology: Statements

- **Statement 1.** Parallel Coordinates, CPC and SPC preserve L^p distances for $p=1$ and $p=2$, $D(x,y) = D^*(x^*,y^*)$.
- **Statement 2** (n points lossless representation). If all coordinates X_i do not overlap then GLC-PC algorithm provides bijective 1:1 mapping of any n -D point x to 2-D directed graph x^* .
- **Statement 3** (n points lossless representation). If all coordinates X_i do not overlap then GLC-PC and GLC-SC1 algorithms provide bijective 1:1 mapping of any n -D point x to 2-D directed graph x^* .
- **Statement 4** ($n/2$ points lossless representation). If coordinates X_i and X_{i+1} are not collinear in each pair (X_i, X_{i+1}) then GLC-CC1 algorithm provides bijective 1:1 mapping of any n -D point x to 2-D directed graph x^* with $\lceil n/2 \rceil$ nodes and $\lceil n/2 \rceil - 1$ edges.
- **Statement 5** ($n/2$ points lossless representation). If coordinates X_i and X_{i+1} are not collinear in each pair (X_i, X_{i+1}) then GLC-CC2 algorithm provides bijective 1:1 mapping of any n -D point x to 2-D directed graph x^* with $\lceil n/2 \rceil$ nodes and $\lceil n/2 \rceil - 1$ edges.

Adjustable GLCs for decreasing occlusion and pattern simplification

Simplicity is the ultimate sophistication.
Leonardo da Vinci

(a) Data in Parallel Coordinates – non-preattentive representation.

(b) Data in the Shifted Parallel Coordinates – preattentive representation.

(c) Data in the Shifted General Line Coordinates – preattentive representation.

(d) Data in the scaled Parallel Coordinates – preattentive representation

Non-preattentive vs. preattentive visualizations (linearized patterns): 6-D point A = (3, 6, 4, 8, 2, 9) in blue, and 6-D point B = (3.5, 6.8, 4.8, 8.5, 2.8, 9.8) in orange in Traditional, Shifted Parallel Coordinates, and GLC.

(a) Original visual representation of the two classes in the Parallel Coordinates,

(b) Simplified visual representation after the shifting and reordering of the Parallel Coordinates.

Simplification of the visual representation by the shifting and reordering of the Parallel Coordinates

Case Studies: World Hunger data

4-D data: representation of prevalence of undernourished in the population (%) in Collocated Paired Coordinates

4-D data: representation of prevalence of undernourished in the population (%) in traditional time series (equivalent to Parallel Coordinates for time series)

The Global Hunger Index (GHI) for each country measures as,

$$\text{GHI} = (\text{UNN} + \text{UW5} + \text{MR5}) / 3,$$

where UNN is the proportion of the population that is Undernourished (in %), UW5 is the prevalence of Underweight in children under age of five (in %), and MR5 is the Mortality rate of Children under age five (in %).

Case Studies: Health Monitoring with PC and CPC

a) PSPC: The green dot is the desired goal state, the red arrow is the initial state, the orange arrow is the health state at the next monitoring time, and the light green arrow is the current health state of the person.

4-D Health monitoring visualization in PSPC (a) and Parallel Coordinates (b) with parameters: systolic blood pressure, diastolic blood pressure, pulse, and total cholesterol at four time moments.

(b) the same data as in (a) in Parallel Coordinates.

The colors show the progress to the goal.

- Dark green dot – goal.
- Yellow and light green -- closer to the goal point.
- Red arrow -- initial health status.

- Experiments -- people quickly grasp how to use this health monitor.
- This health monitor is expandable.
- Two more indicators is another pair of shifted Cartesian Coordinates.
 - The goal is the same dark green 2-D dot
 - Each graph has two connected arrows.
- Graphs closer to the goal are smaller.

Case studies: Knowledge Discovery and Machine Learning for Investment Strategy with CPC

- The CPC visualization shows **arrows** in (V_r, Y_r) space of **volume V_r** and **relative main outcome variable Y_r**
- This is a part of the data shown as traditional time series with *time* axis.
- CPC has no time axis. The **arrow direction shows time**.
- The arrow beginning is the point in the space (V_{ri}, Y_{ri}) , and its head is the **next time point** in the collocated space (V_{ri+1}, Y_{ri+1}) .
- CPC give the **inspiration idea** for building a trading strategy in contrast with time series figure without it.
 - It allows finding the areas with clusters of two kinds of arrows.
 - The arrows for the long positions are green arrows.
 - The arrows for the short positions, are red.
 - Along the Y_r axis we can observe a type of change in Y in the current candle. if $Y_{ri+1} > Y_{ri}$ then $Y_{i+1} > Y_i$ the right decision in i -point is a long position opening. Otherwise, it is a short position.
 - Next, CPC shows the effectiveness a decision in the positions.
 - The **very horizontal** arrows indicates **small profit**
 - A **more vertical** arrows indicates the **larger profit**.
- In comparison with traditional time series, the CPC bring the **additional knowledge about the potential of profit** in selected area of parameters in (V_r, Y_r) space.

Comparison of two time series: relative outcome Y_r and relative volume in every one hundred period.

Some examples of arrows which show points of

Visual Text Mining: Discovery of Incongruity in Humor Modeling

All intellectual labor is inherently humorous.

George Bernard Shaw

Incongruity process for model M .

Time	Description
t_1	Agent G (human or a software agent) reads the first part of the text P_1 and concludes (at a <i>surface</i> level) that P_1 is a usual text.
t_2	Agent G reads the second part of the text P_2 and concludes that (at a <i>surface</i> level) that P_2 is a usual text.
t_3	Agent G starts to analyze a <i>relation</i> between P_1 and P_2 (at a <i>deeper</i> semantic level). Agent G retrieves semantic features (words, phrases) $F(P_1)$ of P_1 .
t_4	Agent G retrieves semantic features (words, phrases) $F(P_2)$ of P_2 .
t_5	Agent G compares (correlates) features $F(P_1)$ with P_2 and features $F(P_2)$ with P_1 finding significant differences in meaning (<i>incongruity</i>).
t_6	Agent G reevaluate usability of P_2 taking in to account these correlations and concludes that P_2 is unusual.

Confusion matrix for visual classification rule R1

	Predicted joke	Predicted non-joke
Actual jokes 17	15	2
Actual non-jokes 17	2	15

We record this visual discovery as a rule R2:

R2: If $z_3 < z_4$ then $\mathbf{z}$ is a joke, else $\mathbf{z}$ is a non-joke.

The resulting C4.5 rule R3 is

If $z_3 < z_4 < 0.0075$ then $\mathbf{z}$ is a joke,

else $\mathbf{z}$ is a non-joke.

Collocated Paired Coordinate plot of meaning context correlation over time. The set of jokes and non-jokes plotted as meaning correlation over time using collocated paired coordinates.

Monotone Boolean space of jokes (green dots) and non-jokes (red dots).

R4: If $(\mathbf{w} \geq (1,0,1,1) \vee \mathbf{w} \geq (0,1,0,1))$ then $\mathbf{w}$ is joke else $\mathbf{w}$ is a non-joke.

Case study: Recognition of digits

Dimension reduction

Experiments with 900 samples of MNIST dataset for digits 0 and 1. Results for the best linear discriminant function of the first run of 20 epochs.

Experiments with 900 samples of MNIST dataset for digits 0 and 1. Results of the automatic dimension reduction displaying 249 dimensions with 235 dimensions removed with the accuracy dropped by 0.28%.

Case study: Recognition of digits

Dimension reduction

Lossy but controlled Dimension Reduction with NN autoencoder

- Input layer = Output layer
- 484 nodes each
- Hidden layer has 24 nodes

Cropped input Images 22x22 = 484 pixels
cropped edges from 784 pixels

Decoded
images
with
hidden
Layer:
24 nodes

- A subset of the testing set between 50 to 100 samples for each digit
- 24-dimensional data with 10 different classes
- 24/784 is 3% after preprocessing and decoding

Case study: Digit recognition, Dimension reduction

Encoded digit 0 and digit 1 on and GLC-L, using 24 dimensions found by the Autoencoder among 484 dimensions. Results for the best linear discriminant function of the first run of 20 epochs.

Encoded digit 0 and digit 1 on GLC-L, using 24 dimensions found by the Autoencoder among 484 dimensions. Another run of 20 epochs, best linear discriminant function from this run. Accuracy drops 1%.

Encoded digit 1 in Parallel Coordinates using 24 dimensions found by the Autoencoder among 484 dimensions. Each vertical line is one of the 24 features scaled in the [0,35] interval. Digit 1 is visualized on the parallel coordinates.

Encoded digit 0 in Parallel Coordinates using 24 dimensions found by the Autoencoder among 484 dimensions. Each vertical line is one of the 24 features scaled in the [0,35] interval. Digit 0 is visualized in Parallel Coordinates.

Collaborative visual discovery

Data and Task Split-based Collaborative Visualization framework.

Collaboration diagram with data example 1.

Data splitting for Collaborative Visualization.

Task splitting for Collaborative Visualization.

Collaboration diagram with data example 2.

Experiments: success in dimension $n > 100$

Current Software

Case study: Recognition of digits

MNIST --benchmark dataset for hand written digit recognition 60,000 training samples and 10,000 testing samples

MNIST subset for digits 0 and 1 data set showing training dataset (70% of the whole dataset) when trained on the training dataset to find the coefficients.

MNIST subset for digits 0 and 1 dataset showing validation dataset (30% of the whole dataset) when trained on the training dataset to find the coefficients.

Projecting validation set.

Summary on General Line Coordinates

- The examples and cases studies show that hybrid methods with General Line Coordinates are capable
 - **visualizing** data of multiple dimensions from 4-D to 484-D without loss of information and
 - **discovering** patterns by combining humans perceptual capabilities and Machine Learning / Data Mining algorithms for classification such high-dimensional data.
- This Hybrid technique can be developed further in multiple ways to deal with different new challenging data science tasks.

Approaches to explain deep and other ML models by visual means

- Explaining ML models including deep learning models by visual means
 - *activation and weight visualization,*
 - *heat-map-based methods,*
 - *dependency analysis,*
 - *monotonicity approach – monotone Boolean functions and chains;*
 - *decision tree visualization, and others.*

Tools for explaining deep learning models

- Tools that **visualize activations** generated on every layer of a trained convolutional net during image/video recognition.
 - *Benefits: builds intuitions how the network work (algorithm tracing).*
- Tool that **visualize features** at every layer of a network discovered by optimization in image space.
 - *Challenge -- **blurred** and less recognizable images of features.*
 - *Approach: new **regularization methods** for optimization to generate clearer, more interpretable visualizations.*
- A new term -- **deep visualization**

Visualization of Image features in heat map

CIFAR-10 classification benchmark problem is to classify RGB 32x32 pixel images across 10 categories

Montavon G, Samek W, Müller KR. Methods for interpreting and understanding deep neural networks.

Digital Signal Processing. 2018 Feb 1;73:1-5.

Tensor flow CIFAR-10 CNN model

- CIFAR-10 is a multi-layer network with
 - *alternating convolutions and nonlinearities followed by fully connected layers and softmax classifier.*
 - *Peak accuracy ~ 86%*
 - *few hours of training on a GPU.*
 - *~ 1M learnable parameters*
 - *19.5M multiply-add operations to compute inference on a single image.*

Layer Name	Description
conv1	<code>tf.nn.conv2d</code> and <code>tf.nn.relu</code> activation.
pool1	<code>tf.nn.max_pool</code> .
norm1	<code>tf.nn.local_response_normalization</code> .
conv2	<code>tf.nn.conv2d</code> and <code>tf.nn.relu</code> activation.
norm2	<code>tf.nn.local_response_normalization</code> .
pool2	<code>tf.nn.max_pool</code> .
local3	fully connected layer with rectified linear activation.
local4	fully connected layer with rectified linear activation.
softmax_linear	linear transformation to produce logits.

Discovering human explainable visualization of what a deep neural network has learned

- Comparison of three heatmaps for digit '3'.
- Left:
 - *The randomly generated heatmap – no interpretable information.*
- Middle:
 - *The segmentation heatmap – shows the whole digit without relevant parts, say, for distinguishing '3' from '8' or '9'.*
- Right:
 - *A relevance heatmap – shows parts of the image used by the classifier.*
 - *Reflects human intuition on differences between '3', '8' and '9' and other digits.*

Samek W, Binder A, Montavon G, Lapuschkin S, Müller KR. Evaluating the visualization of what a deep neural network has learned. IEEE transactions on neural networks and learning systems. 2017 Nov;28(11):2660-73.

Comparison of the three heatmap computations

Left:

- **Sensitivity heatmaps** (local explanations) – measure **change of the class** when specific pixels are changed based on **partial derivatives**.
- applicable to architectures with differentiable units.

Middle:

- **Deconvolution method** (“autoencoder”)– applies a convolutional network g to the output of another convolutional network f . Network g “undoes” f .
- **Challenge:** Unclear relation between heatmap scores and the classification output $f(x)$.

Right:

- **Layer-wise Relevance Propagation (LRP)** – exactly decomposes the classification output $f(x)$ into pixel relevancies by observing the layer-wise evidence for class preservation (conservation principle).
- Applicable to generic architectures (including with non-continuous units) – does not use gradients.
- Globally explains the classification decision and heatmap scores
- Have a clear interpretation as evidence for or against a class.

Samek W, Binder A, Montavon G, Lapuschkin S, Müller KR. Evaluating the visualization of what a deep neural network has learned. IEEE transactions on neural networks and learning systems. 2017 Nov;28(11):2660-73.

Multifaceted Feature Visualization

- Based on “fooling” images, scientists previously concluded that DNNs trained with supervised learning **ignore an object’s global structure**, and instead only **learn a few, discriminative features per class** (e.g. color or texture) (Nguyen et al., 2015).
- Multifaceted Feature Visualization algorithm:
 - shows the multiple feature facets each neuron detects,
 - reduces optimization’s tendency to produce repeated object fragments
 - tends to produce one central object.
- Benefits
 - more comprehensive understanding of each neuron’s function.
 - increases understanding of deep neural networks,
 - Opens opportunity to create more powerful deep learning algorithms.

Nguyen, A., Yosinski, J., Clune, J. Deep neural networks are easily fooled: High confidence predictions for unrecognizable images. In Proc. of the CVPR Conference, 2015.

Nguyen A, Yosinski J, Clune J. Multifaceted feature visualization: Uncovering the different types of features learned by each neuron in deep neural networks. arXiv preprint arXiv:1602.03616. 2016.

Learning deep features for scene recognition using places database

- Challenge:
 - performance at scene recognition is lower than for object recognition.
- Reasons:
 - Current deep features trained from ImageNet are not competitive enough for such tasks.
- Approach:
 - new scene-centric database called Places with over **7 million labeled pictures of scenes**.
 - New methods to compare the **density and diversity** of image datasets
 - **CNN** to learn deep features for scene recognition
 - **Visualization** of the CNN layers' responses to show differences in the internal representations of object-centric and scene-centric networks.

Zhou B, Lapedriza A, Xiao J, Torralba A, Oliva A. Learning deep features for scene recognition using places database. In: Advances in neural information processing systems 2014 (pp. 487-495).

Heat map visualization in identification of diabetic retinopathy using deep learning

- A common method of combining results of Deep Learning (DL) from images with visualization is:
 - *discovering classification model for images using a DL algorithm,*
 - *identifying informative deep features (inner features constructed by this DL algorithm), and*
 - *visualizing identified deep features on the original image.*
- The methods of visualization of these features range from
 - *outlining the area of deep features to*
 - *overlaying the heat map in these areas (B in the image).*
- The last method was used for retinal images in diabetic retinopathy diagnostics.

Visualization maps generated from deep features. A, Fundus heatmap overlaid on a fundus image, highlighting pathologic regions in the nasal and temporal quadrants. B, Pathologic findings in the upper and lower left quadrants. These visualizations are generated automatically, locating regions for closer examination after a patient is seen by a consultant ophthalmologist.

Gargeya R, Leng T. Automated identification of diabetic retinopathy using deep learning. *Ophthalmology*. 2017 Jul 1;124(7):962-9.

Unsupervised feature learning for audio classification using Convolutional Deep Belief Network (CDBN)

- Computational Approach
 - Convert time-domain signals into spectrograms.
 - Extract spectrogram with overlaps from each TIMIT training data case.
 - Reduce dimension of the spectrogram by PCA to 80 principal components.
 - Training first-layer cases.
 - Training second-layer cases using first-layer activations as input.
- Visualization Approach
 - Finding what the network “learns” using visualization.
 - Visualizing the first layer bases
 - Visualizing each second-layer learned representation as a weighted linear combination of the first-layer bases.

A spectrogram is heap map image with axes for *time and frequency* and intensity or color of a point for amplitude.

TIMIT — recordings of **630 speakers** of eight major dialects of American English, each reading ten phonetically rich sentences.

Columns – time interval of first-layer in the spectrogram space.
Rows – frequency channels ordered from lowest to highest one.

Lee H, Pham P, Largman Y, Ng AY. Unsupervised feature learning for audio classification using convolutional deep belief networks. In Advances in neural information processing systems 2009, pp. 1096-1104.

Heat maps visualization and explanation of deep learning for pulmonary tuberculosis

Chest radiograph with pathologically proven active TB.

The same radiograph with a heat map overlay of a strongest activations from the 5th convolutional layer from GoogLeNet-TA classifier.

*The red and light blue regions in the upper lobes -- areas activated by the deep neural network . (areas where the disease is present)
The dark purple background -- areas that are not activated.*

Nonlinear feature space dimension reduction in breast computer-aided diagnosis (CADx) with Laplacian eigenmaps and *t*-SNE

■ Goals:

- Enhancing breast CADx with unsupervised dimension reduction (DR)
- representation of computer-extracted breast lesion feature spaces for
 - 1126 ultrasound cases,
 - 356 MRI cases,
 - 245 mammography 245 cases.

■ DR methods:

- Laplacian eigenmaps (graph based)
- *t*-distributed stochastic neighbor embedding (*t*-SNE) – probability distribution based)

■ Intension of DR methods:

- Convert high dimensional feature spaces to more human interpretable lower dimensional spaces preserving local and global information.

■ Malignancy classifiers:

- Markov chain Monte Carlo based Bayesian artificial neural network (MCMC-BANN)
- and Linear Discriminant Analysis (LDA).

■ Evaluation criteria:

- Performance of classifiers with DR relative to malignancy classification
- (using receiver operating curve (ROC) analysis, 95% empirical confidence intervals for each classifier's area under curve (AUC) for ROC curves).
- Visual inspection of sparseness of 2-D and 3-D mappings.
- Comparison with previous breast CADx (automatic relevance determination and linear stepwise (LSW) feature selection, a linear DR based on PCA, and Automatic relevance determination (ARD) feature selection)

■ Results:

- Slightly higher performance of 4-D *t*-SNE mapping (from the original 81-D feature space) relative to 13 ARD selected features and 4 LSW selected features for large ultrasound dataset using the MCMC-BANN classifier.

■ Conclusion:

- DR techniques offer a complementary approach to known tools.
- Added benefit – delivering sparse lower dimensional representations for visual interpretation, revealing intricate data structure of the feature space.

Lossy visualizations for ML models

- 2D and 3D visualizations of **unsupervised** reduced dimension representations of 81-D breast lesion ultrasound feature data
green – Benign lesions, Red - Malignant, Yellow – Benign-cystic.
- Visualization of linear reduction using
 - (a) PCA, first two principal components
 - (b) first three principal components, 3D PCA.
 - (c) 2D and (d) 3D visualization of the nonlinear reduction mapping using t-SNE
 - (e) 2D and (f) 3D visualization of the nonlinear mapping using Laplacian eigenmaps.
- Discussion:
 - Methods like T-SNE, PCA and others do not preserve all information of initial features (they are lossy visualizations of n-D data)
 - They convert 81 interpretable features to 2-3 artificial features that have no direct interpretation
 - General Line Coordinates is an alternative that preserves all n-D information when occlusion/clutter in visualization is suppressed that was successfully done in [Kovalerchuk et al, 2014-2019]

Jamieson, A.R.; Giger, M.L.; Drukker, K.; Lui, H.; Yuan, Y.; Bhooshan, N. Exploring Nonlinear Feature Space Dimension Reduction and Data Representation in Breast CADx with Laplacian Eigenmaps and t-SNE. Medical Physics. 37 (1): 339–351. 2010

T-SNE visualization for explainable AI in intrusion detection systems: an adversarial approach

- Goal:
 - Increase understanding of “black-box” Deep Neural Networks (DNN) models.
- Approach:
 - Explain **miss-classifications** made by Intrusion Detection Systems
 - find **minimum modifications** (of the input features) to **correct classification** of misclassified cases by using adversarial machine learning
 - Make intuitive visualization of magnitude of max modifications as **most explanatory features** for the misclassification.
- Results:
 - Experiments on the NSL-KDD99 benchmark data using **Linear and Multilayer perceptrons** that match expert knowledge.
- The advantages:
 - Applicable to **any classifier** with defined gradients.
 - Does not require modification of the classifier model.
 - Can be extended to further understanding and diagnosis (e.g., vulnerability assessment) of the system.

■ Discussion:

- T-SNE does not preserve all information of modified values of initial features (it is a lossy visualization of n-D data)
- T-SNE converts interpretable features to 2-3 artificial features that have no direct interpretation
- General Line Coordinates is an alternative to T-SNE that preserve all n-D information, but potentially suffer more from occlusion/clutter in visualization.

(a) misclassified samples x_0

(b) misclassified x_0 and modified samples $\hat{x}$

t-SNE visualization of misclassified samples and corresponding modified samples for the MLP classifier. The legend shows the class

Approaches to discover analytical ML models assisted by visual means

- Discovering visual ML models assisted by analytical ML algorithms, such as
 - *propositional and first order rules,*
 - *random forests,*
 - *CNN,*
 - *decision trees,*
 - *optimization based on genetic and other algorithms*

Quality-based guidance for exploratory dimensionality reduction

- Problem:
 - Difficulty or inability to **represent effectively high-dimensional data** with hundreds of variables by visualization methods
- Known solutions:
 - Employing **dimensionality reduction (DR)** prior to visualization.
- Challenge:
 - DR can throw a *baby with bathwater* –loss of information of full high-dimensional data.
- Approach: interactive environment to **understand** high-D data first with:
 - Discovering **structure of full high-dimensional data** without reduction.
 - Identifying **importance and interestingness** of structures and variables.
 - Using several metrics of ‘interestingness’ of variables.
 - Using PCA to combine metrics and get new “principal” metrics.
- Use case:
 - DNA sequence-based study of bacterial populations.

Workflow

The primary window of the interactive environment displaying a bacterial population data set, which includes 184 variables. The quality metric profiles of the variables are displayed in the Ranking and quality view (top left view) and in the Glyph view (top right view). The high-dimensional data set is displayed in the bottom view.

Fernstad SJ, Shaw J., Johansson J., Quality-based guidance for exploratory dimensionality reduction, Information Visualization 12(1) 44–64, 2013

Quality-based guidance for exploratory dimensionality reduction

Highest ranked operational taxonomic units (OTUs) in a scatter plot matrix, where positive and negative correlations are represented by blue and red cells.

Top – visualizations of quality metrics of variables using parallel coordinates and glyphs.
In parallel coordinates,

axes are quality metrics, and
polylines are the **variables**.

In the glyph plot,

axes are first two “principal metrics”

glyphs are located at the points with values of these metrics for each variable.

glyph is a set of squares

each square represents one metric

opacity of the square represents the metric value.

the fill color of the square is the same as the axis of the parallel coordinates

the border color of the glyph is the color of polylines in parallel coordinates.

The variable merging window, including a list of suggestions for variable groups to merge

An Interactive Large-Scale Graph Mining and Visualization

- Problem:
 - Exploring efficiently a large graph with **several millions or billions of nodes and edges**, such as a social network?
- Solution:
 - **Perseus**, an integrative system for analysis of large graphs
- Approach:
 - **summarization** of graph properties and structures,
 - guiding attention to outliers,
 - exploration of normal and anomalous node behaviors.
 - automatic extraction of graph **invariants** (e.g., degree, PageRank, real eigenvectors)
 - scalable online batch processing on Hadoop;
 - visualization of 1-D and 2-D **distributions of invariants**
 - Visualization of a **subgraph** of the selected node and its neighbors, by incrementally revealing its neighbors.
- Use Cases: multi-million-edge social networks
 - Wikipedia vote network,
 - friendship/foeship network in Slashdot, and
 - trust network based on the consumer review website Epinions.com.

(a) The selected point X in the degree distribution plot maps to the cyan points in the other two plots.

(b) Egonet of node A.

(c) Egonet of node B.

Contrastive and Visual Topic Modeling for Comparing Documents

- Problem:
 - How to express similarities/differences of 'labeled' document collections and visualize them efficiently?
- Approach
 - Learn hidden topics and embeddings for the documents, topics and labels for visualization.
 - Extract hidden discriminative and common topics across labeled documents.
 - Visualize all documents, labels, and the extracted topics, where proximity in the coordinate space is reflective of proximity in semantic space;
 - extract topics and visual coordinates simultaneously under a joint model.
 - Probabilistic approach to create a visualization space that differs from t-SNE.
- Results:
 - outperforms both unsupervised and supervised state-of-the-art topic models in contrastive power, semantic coherence and visual effectiveness on real world data.

Contrastive analysis of sports, arts, style documents from NYTnews (20 topics).

ContraVis: (supervised joint method) finds latent discriminative topics and gives visual embedding of documents and topics. Two discriminative topics per label shown in wordclouds (w/ respective colors) + one common topic (black);

Monotone Boolean Function visualization vs. Parallel Coordinates for binary data

(c) cancer visualization in centered chain order

(j) Highly overlapped parallel coordinate visualization of the same data (yellow - benign, red - malignant)

(f) biopsy visualization in centered chain order

(k) Types of source X-ray mammography images used producing Boolean vectors

Conclusion

- The tutorial covered **five complementary approaches**:
 1. to **visualize** ML models produced by **analytical** ML methods,
 2. to **discover** ML models by **visual** means,
 3. to **explain** deep and other ML models by visual means,
 4. to **discover visual** ML models assisted by **analytical** ML algorithms,
 5. to **discover analytical** ML models assisted by **visual** means.
- All of them benefit data science now and will continue in the future.

New tasks for visual knowledge discovery

- Expansion to new applications in finance, medicine, NLP, image processing and others
- Deepen links with Deep Learning methods
- Expansion of hybrid approach to prevent overgeneralization and overfitting of predictive models by using visual means.
- Multiple “n-D glasses” as a way to super-intelligence and virtual data scientists.

Future of Interpretability

- Creating **simplified explainable** models with prediction that humans can actually **understand**.
- “**Downgrading**” complex models for humans to understand by adding the explanation layer to the CNN and other deep learning models.
- Expanding **visual** and **hybrid explanation** models
